# Experimentation 

Jaime Arguello<br>INLS 613: Text Data Mining<br>jarguell@email.unc.edu

## Outline

## Cross-Validation

Significance tests

## Training and Testing

## Training and Testing

- Split the data into two sets.
- Find the parameter values that maximizes performance on the training set.
- Evaluate the system with that parameter value on the test set.

## Cross-Validation

## Cross-Validation

- Split the data into $\mathrm{N}=5$ folds

## Cross-Validation

- For each fold:
- Train a model on the union of the other folds
- Test on the holdout fold

$\mathrm{F}=0.50$

## Cross-Validation

- For each fold:
- Train a model on the union of the other folds
- Test on the holdout fold

## Cross-Validation

- For each fold:
- Train a model on the union of the other folds
- Test on the holdout fold

$$
F=0.70
$$

## Cross-Validation

- For each fold:
- Train a model on the union of the other folds
- Test on the holdout fold

## Cross-Validation

- For each fold:
- Train a model on the union of the other folds
- Test on the holdout fold

$$
F=0.50
$$

## Cross-Validation

- For each fold:
- Train a model on the union of the other folds
- Test on the holdout fold

## Cross-Validation

- Average the performance across held-out folds

What should we set N to?

## Outline

## Cross-Validation

Significance tests

## Comparing Systems

- Train and test both systems using 10fold cross validation
- Use the same folds for both systems
- Compare the difference in average performance across held-out folds

| Fold | System A |
| :---: | :---: |
| 1 | 0.2 |
| 2 | 0.3 |
| 3 | 0.1 |
| 4 | 0.4 |
| 5 | 1 |
| 6 | 0.8 |
| 7 | 0.3 |
| 8 | 0.1 |
| 9 | 0 |
| 10 | 0.9 |
| Average | 0.41 |
|  | Difference |

System B
0.5
0.3
0.1
0.4 1
0.9
0.1
0.2
0.5
0.8
0.48
0.07

## Significance Tests <br> motivation

- Why would it be risky to conclude that System $B$ is better System A?
- Put differently, what is it that we're trying to achieve?

## Significance Tests motivation

- In theory: that the average performance of System B is greater than the average performance of System A for all data.
- However, we don't have all data. We have a sample
- And, this sample may favor one system vs. the other!

## Significance Tests <br> definition

- A significance test is a statistical tool that allows us to determine whether a difference in performance reflects a true pattern or just random chance

## Significance Tests ingredients

- Test statistic: a measure used to judge the two systems (e.g., the difference between their average F-measure)
- Null hypothesis: no "true" difference between the two systems
- P-value: take the value of the observed test statistic and compute the probability of observing a value that large (or larger) under the null hypothesis

## Significance Tests ingredients

- If the p-value is large, we cannot reject the null hypothesis
- That is, we cannot claim that one system is better than the other
- If the $p$-value is small ( $p<0.05$ ), we can reject the null hypothesis
- That is, the observed test statistic is not due to random chance

## Comparing Systems

- P-value: the probability

| Fold | System A | System B |
| :---: | :---: | :---: |
| 1 | 0.2 | 0.5 |
| 2 | 0.3 | 0.3 |
| 3 | 0.1 | 0.1 |
| 4 | 0.4 | 0.4 |
| 5 | 1 | 1 |
| 6 | 0.8 | 0.9 |
| 7 | 0.3 | 0.1 |
| 8 | 0.1 | 0.2 |
| 9 | 0 | 0.5 |
| 10 | 0.9 | 0.8 |
| Average | 0.41 | 0.48 |
|  | Difference | 0.07 |
|  |  |  |

## Fisher's Randomization Test

 procedure- Inputs: counter $=0, \mathrm{~N}=100,000$
- Repeat N times:

Step 1: for each fold, flip a coin and if it lands 'heads', flip the result between System A and B

Step 2: see whether the test statistic is equal to or greater than the one observed and, if so, increment counter

- Output: counter / N

## Fisher's Randomization Test

| Fold | System A | System B |
| :---: | :---: | :---: |
| 1 | 0.2 | 0.5 |
| 2 | 0.3 | 0.3 |

|  | Difference | 0.182 |
| iteration $=\mathbf{2} \quad$ counter $=\mathbf{1}$ |  |  |

at least 0.07 ?

## Fisher's Randomization Test

| Fold | System A | System B |  |
| :---: | :---: | :---: | :---: |
| 1 | $\mathbf{0 . 5}$ | $\mathbf{0 . 2}$ |  |
| 2 | 0.3 | 0.3 |  |
| 3 | $\mathbf{0 . 1}$ | $\mathbf{0 . 1}$ |  |
| 4 | $\mathbf{0 . 4}$ | $\mathbf{0 . 4}$ |  |
| 5 | 1 | 1 |  |
| 6 | $\mathbf{0 . 9}$ | $\mathbf{0 . 8}$ |  |
| 7 | 0.3 | 0.1 |  |
| 8 | 0.1 | 0.2 |  |
| 9 | $\mathbf{0 . 5}$ | $\mathbf{0}$ |  |
| 10 | 0.9 | 0.8 |  |
| Average | 0.5 | 0.39 | at least |
|  | Difference | -0.11 | $\mathbf{0 . 0 7 ?}$ |
| iteration $=100,000$ | counter $=25,678$ | 26 |  |

## Fisher's Randomization Test

 procedure- Inputs: counter $=0, \mathrm{~N}=100,000$
- Repeat N times:

Step 1: for each query, flip a coin and if it lands 'heads', flip the result between System A and B

Step 2: see whether the test statistic is equal to or greater than the one observed and, if so, increment counter

- Output: counter / N = $(25,678 / 100,00)=0.25678$

## Fisher's Randomization Test

- Under the null hypothesis, the probability of observing a value of the test statistic of 0.07 or greater is about 0.26 .
- Because $p>0.05$, we cannot confidently say that the value of the test statistic is not due to random chance.
- A difference between the average F-measure values of 0.07 is not significant

## Fisher's Randomization Test

 procedure- Inputs: counter $=0, \mathrm{~N}=100,000$
- Repeat N times:

Step 1: for each query, flip a coin and if it lands 'heads', flip the result between System A and B

Step 2: see whether the test statistic is equal to or greater than the one observed and, if so, increment counter

- Output: counter / $\mathrm{N}=(25,678 / \mathrm{I} 00,00)=0.25678$

This is a one-tailed test $(B>A)$.
How can we modify it to be a two-tailed test ( $B!=A$ )

## Fisher's Randomization Test

procedure

- P-value: the probability of observing a
difference in the absolute value equal to or greater than 0.07 under the null
hypothesis (i.e., the systems are actually equal).

System A System B

| Fold | System A | System B |
| :---: | :---: | :---: |

| 8 | 0.1 | 0.2 |
| 9 | 0 | 0.5 |
| 10 | 0.9 | 0.8 |
| Average | 0.41 | 0.48 |
|  | Difference | 0.07 |
|  |  |  |

## Bootstrap-Shift Test motivation

- Our sample is a representative sample of all data

## Bootstrap-Shift Test motivation

- Our sample is a representative sample of all data

## Bootstrap-Shift Test motivation

- If we sample (with replacement) from our sample, we can generate a new representative sample of all data

## Bootstrap-Shift Test procedure

- Inputs: Array $T=\{ \}, \mathrm{N}=100,000$
- Repeat N times:

Step 1: sample 10 folds (with replacement) from our set of 10 folds (called a subsample)

Step 2: compute test statistic associated with new sample and add to T

- Step 3: compute average of numbers in $T$
- Step 4: reduce every number in T by average
- Output: \% of numbers in T greater than or equal to the observed test statistic

## Bootstrap-Shift Test procedure

- Inputs: Array T = \{ $\}, \mathrm{N}=100,000$
- Repeat N times:

Step 1: sample 10 folds (with replacement) from our set of 10 folds (called a subsample)

Step 2: compute test statistic associated with new sample and add to T

- Step 3: compute average of numbers in T
- Step 4: reduce every number in T by average
- Outpuit: \% of numbers in T greater than or equal to the observed test statistic

## Bootstrap-Shift Test procedure

- Inpuits: Array $T=\{ \}, N=100,000$
- Repeat N times:

## Step 1: sample 10 folds (with replacement) from our set of 10 folds (called a subsample)

Step 2: compute test statistic associated with new sample and add to T

- Step 3: compute average of numbers in T
- Step 4: reduce every number in T by average
- Output: \% of numbers in T' greater than or equal to the observed test statistic

## Bootstrap-Shift Test procedure

- For the purpose of this example, let's assume $\mathrm{N}=10$.

$$
\begin{aligned}
& \mathrm{T}=\{0.10, \\
& 0.04, \\
& 0.21, \\
& 0.20, \\
& 0.13, \\
& 0.09, \\
& 0.22, \\
& 0.07, \quad \text { Step } 3 \\
& 0.03, \\
& 0.11\}
\end{aligned}
$$

$$
\begin{aligned}
& T^{\prime}=\{-0.02 \text {, } \\
& \text {-0.08, } \\
& \text { 0.09, } \\
& \text { 0.08, } \\
& \text { 0.01, } \\
& \text {-0.03, } \\
& 0.10 \text {, } \\
& \text {-0.09, } \\
& \text {-0.01\} }
\end{aligned}
$$

Average $=\mathbf{0 . 1 2}$

## Bootstrap-Shift Test procedure

- Inputs: Array $T=\{ \}, \mathrm{N}=100,000$
- Repeat N times:

## Step 1: sample 10 folds (with replacement) from our set of 10 folds (called a subsample)

Step 2: compute test statistic associated with new sample and add to $T$

- Step 3: compute average of numbers in T
- Step 4: reduce every number in T by average
- Output: \% of numbers in T' greater than or equal to the observed test statistic

## Bootstrap-Shift Test procedure

- Output: $(3 / 10)=\mathbf{0 . 3 0}$

$$
\begin{aligned}
& \mathrm{T}=\{0.10, \\
& 0.04, \\
& 0.21, \\
& 0.20, \\
& 0.13, \\
& 0.09, \\

& \text { Average }=\mathbf{0 . 1 2}
\end{aligned}
$$

## Significance Tests

## summary

- Significance tests help us determine whether the outcome of an experiment signals a "true" trend
- The null hypothesis is that the observed outcome is due to random chance (sample bias, error, etc.)
- There are many types of tests
- Parametric tests: assume a particular distribution for the test statistic under the null hypothesis
- Non-parametric tests: make no assumptions about the test statistic distribution under the null hypothesis
- The randomization and bootstrap-shift tests make no assumptions, are robust, and easy to understand
