Evaluation Overview

Jaime Arguello
INLS 509: Information Retrieval

jarguell@email.unc.edu

Given a query and a corpus, find relevant documents

Query: user's textual description of their information need

Corpus: a repository of textual documents

Relevance: satisfaction of the user's information need

- How would you evaluate a search system?
- How would you determining that system A is better than system B?

- In some disciplines, you can prove that solution A is better than B without experimentation.
- Is information retrieval one of these disciplines?
- If not, why not?

- Users may not know what they want
- Even if they do, they may not know how to describe it

- soft surroundings
- trains interlocking dog sheets
- belly dancing music
- christian dior large bag
- best western airport sea tac
- www.bajawedding.com
- marie selby botanical gardens
- big chill down coats
- www.magichat.co.uk

- broadstone raquet club
- seadoo utopia
- seasons white plains condo
- priority club.com
- aircat tools
- epicurus evil
- instructions
- hinds county city of jackson
- last searches on aol a to z

(AOL query-log)

- Even if users knows how to describe their information need, it will probably <u>still</u> be ambiguous
 - to the system
 - to a human trying to see if system A is better than B

Query: curbing population growth

Dengue in Philippines taken seriously at one hotel in Clark Philippines

Jul 18, 2010 23:58 EDT

Philippines government department of Health has issued warning of Dengue epidemic in July 2010 which is expected to last until the end of the year.

While most hotels and resorts are slow to take steps to address this health and safety issues, one hotel in Clark Philippines is already well on its way to implementing proactive measures to prevent the spread of Dengue by curbing population growth of mosquito.

- Document relevance is subjective
 - many factors affect whether a document is relevant to a query
 - relevance is difficult to define in a way that generalizes across users, tasks, and environments

Query: cures for anatidaephobia

Anatidaephobia - The Fear That You are Being Watched by a Duck

December 08, 2008 by **Tammy Duffey**

Popular searches: YouTube | Rihanna | Tiger Woods | Search more

What Is Anatidaephobia?

Anatidaephobia is defined as a pervasive, irrational fear that one is being watched by a duck. The anatidaephobic individual fears that no matter where they are or what they are doing, a duck watches.

Anatidaephobia is derived from the Greek word "anatidae", meaning ducks, geese or swans and "phobos"

meaning fear.

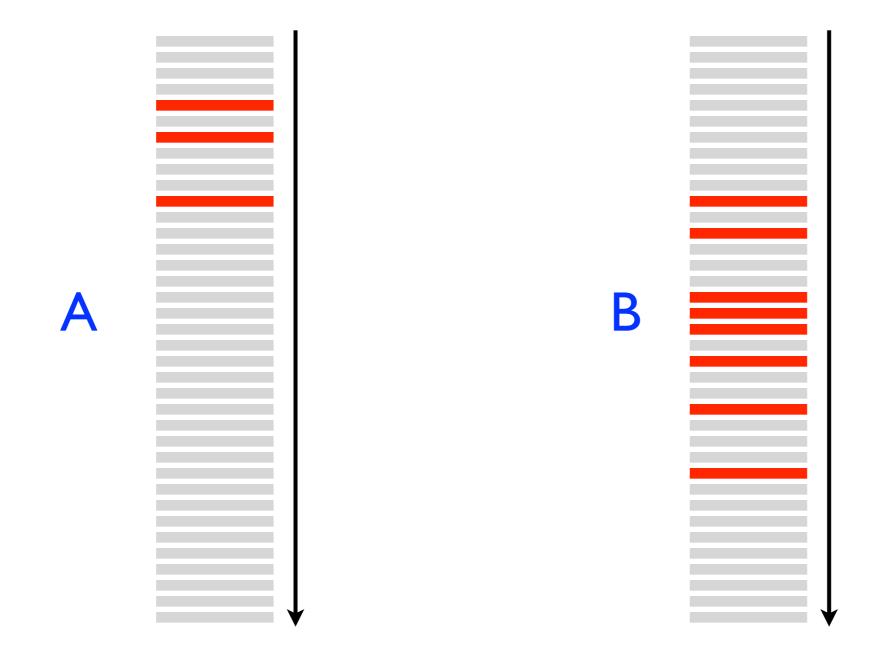

What Causes Anatidaephobia?

As with all phobias, the person coping with Anatidaephobia has experienced a real-life trauma. For the anatidaephobic individual, this trauma most likely occurred during childhood.

Perhaps the individual was intensely frightened by some species of water fowl. Geese and swans are relatively well known for their aggressive tendencies and perhaps the anatidaephobic person was actually bitten or flapped at. Of course, the Far Side comics did little to minimize the fear of being watched by a duck.

 Even if we know which documents are relevant, the preferred ranking may be difficult to determine without understanding the user population and their objectives

Which ranking is better?

- In some disciplines, you can prove that solution A is better than B without experimentation.
- Is information retrieval one of these disciplines?
- No, it is not. There is too much uncertainty
- For now, the only way to show that A is better than B, is through <u>extensive</u> experimentation

Information Retrieval Evaluation

- Evaluation is a fundamental issue of information retrieval
 - an area of IR research in its own right
- Evaluation methods:
 - batch evaluation
 - user-study evaluation
 - online evaluation
- Each method has advantages and disadvantages

Batch Evaluation overview

- Collect a <u>set</u> of queries (to test average performance)
- Construct a more complete description of the information being sought for each query

overview: query + description (example)

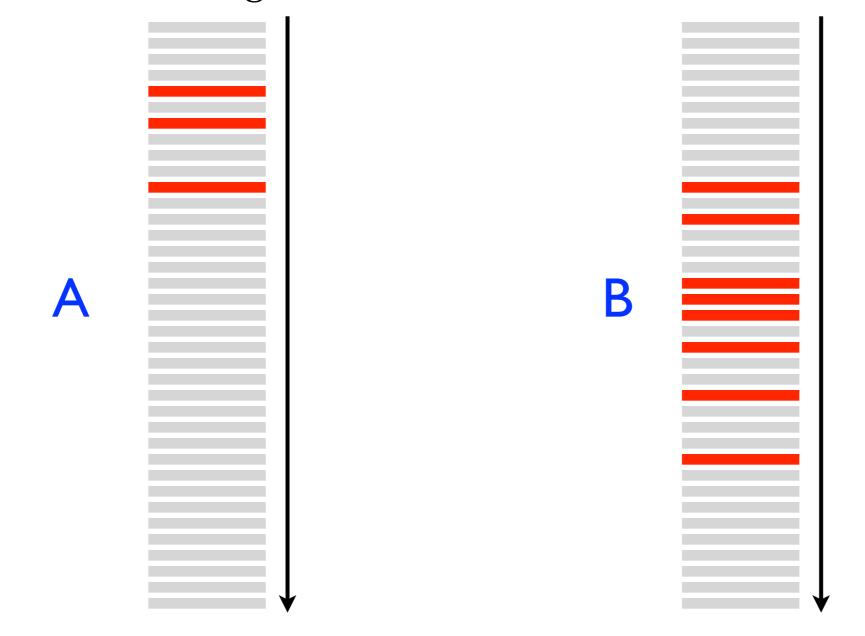

- QUERY: pet therapy
- DESCRIPTION: Relevant documents must include details of how pet- and animal-assisted therapy is or has been used. Relevant details include information about pet therapy programs, descriptions of the circumstances in which pet therapy is used, the benefits of this type of therapy, the degree of success of this therapy, and any laws or regulations governing it.

Batch Evaluation overview

- Using these descriptions, have human judges determine which documents are relevant for each query
- Evaluate systems based on their ability to retrieve the relevant documents for these queries
 - evaluation metric: a measure of the quality of a particular ranking of results with known relevant/nonrelevant documents

overview: metrics

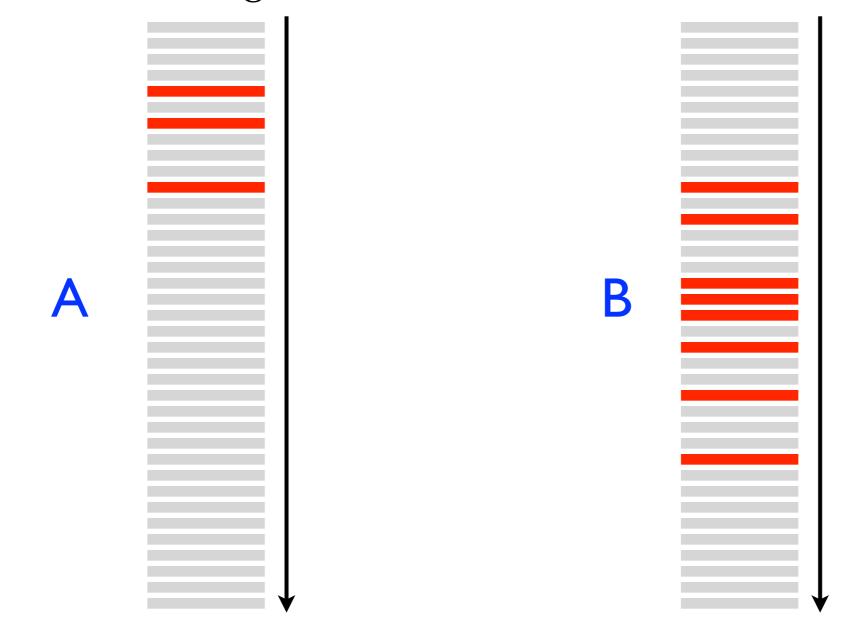

Which ranking is better?

rank of the first relevant document (lower value is better)

overview: metrics

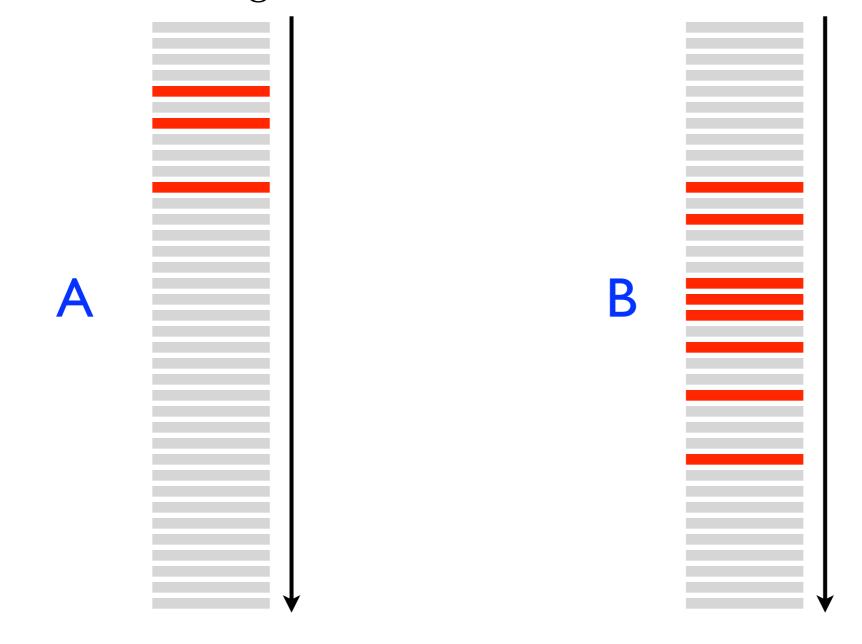

Which ranking is better?

precision at rank 10 (higher value is better)

overview: metrics

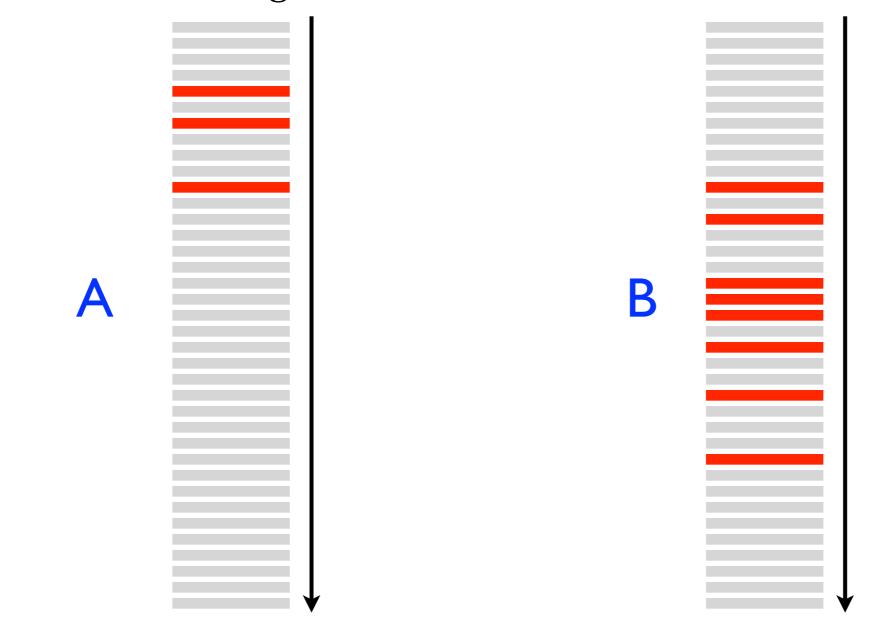

Which ranking is better?

precision at rank 1 (higher value is better)

overview: metrics

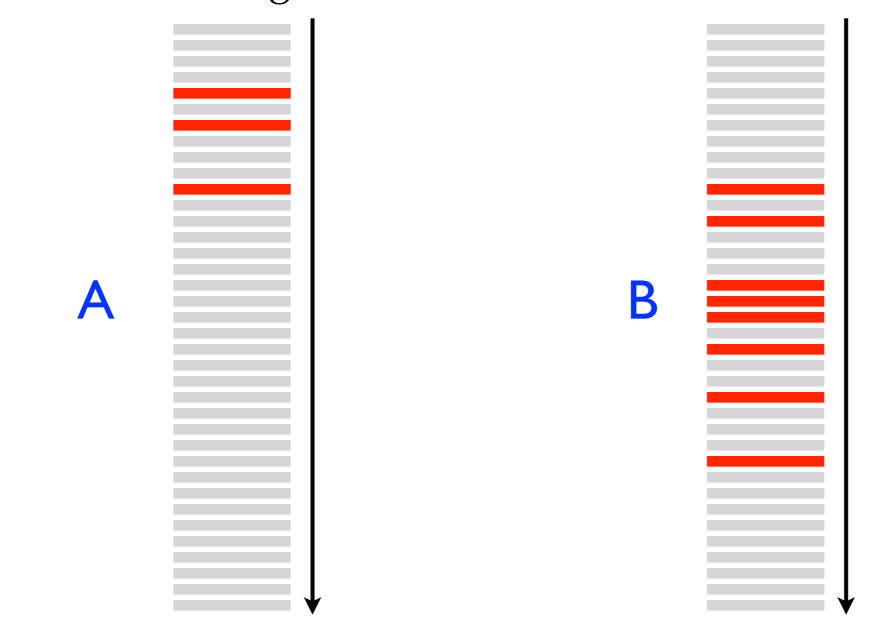

Which ranking is better?

• recall at rank 10 (higher value is better)

overview: metrics

Which ranking is better?

• recall at rank 30 (higher value is better)

overview: trade-offs

Advantages:

- inexpensive (once the test collection is constructed)
- the experimental condition is fixed; same queries, and same relevance judgements
- evaluations are reproducible; keeps us "honest"
- by experimenting on the same set of queries and judgements, we can better understand <u>how</u> system
 A is better than B

overview: trade-offs

Disadvantages:

- high initial cost. human assessors (the ones who judge documents relevant/non-relevant) are expensive
- human assessors are not the users; judgements are made "out of context"
- assumes that relevance is the same, independent of the user and the user's context

overview: trade-offs

- Many factors affect whether a document satisfies a particular user's information need
- Topicality, novelty, freshness, authority, formatting, reading level, assumed level of expertise
- Topical relevance: the document is on the same topic as the query
- User relevance: everything else
- Which kind of relevance does batch-evaluation address?

overview: trade-offs

- Many factors affect whether a document satisfies a particular user's information need
- Topicality, novelty, freshness, authority, formatting, reading level, assumed level of expertise
- Topical relevance: the document is on the same topic as the query
- User relevance: everything else
- Which kind of relevance does batch-evaluation address?
- Mostly topical relevance

User-Study Evaluation overview

- Provide a small set of users with several retrieval systems
- Ask them to complete several (potentially different) search tasks
- Learn about system performance by:
 - observing what they do
 - asking about their actions and thought processes
 - measuring success (task completion, time, etc.)
 - measuring <u>perceived</u> success (questionnaire data)

User-Study Evaluation

overview: trade-offs

Advantages:

- very detailed data about users' reaction to systems
- in reality, a search is done to accomplish a higherlevel task
- in user studies, this task can be manipulated and studied
- in other words, the experimental 'starting-point' need not be the query

User-Study Evaluation

overview: trade-offs

Disadvantages:

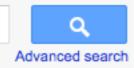

- user studies are expensive (pay users/subjects, scientist's time, data coding)
- difficult to generalize from small studies to broad populations
- the laboratory setting is not the user's normal environment
- need to re-run experiment every time a new system is considered

On-line Evaluation

overview

- Given a search service with an existing user population (e.g., Google, Yahoo!, Bing) ...
- Have x% of query traffic use system A and y% of querytraffic use system B
- Compare system effects on logged user interactions (implicit feedback)
 - clicks: surrogates for perceived relevance (good)
 - skips: surrogates for perceived non-relevance (bad)

the absence of a click is a noisy surrogate for non-relevance

On-Line Evaluation

overview: trade-offs

Advantages:

- system usage is naturalistic; users are situated in their natural context and often don't know that a test is being conducted
- evaluation can include <u>lots</u> of users

On-Line Evaluation

overview: trade-offs

Disadvantages:

- requires a service with lots of users (enough of them to potential hurt performance for some)
- this is often referred to as the "cold-start problem"
- requires a good understanding on how different implicit feedback signals correlate with positive and negative user experiences
- experiments are difficult to repeat

Information Retrieval Evaluation

- Evaluation is a fundamental issue of information retrieval
 - an area of IR research in its own right
- Evaluation methods:
 - batch evaluation
 - user-study evaluation
 - online evaluation
- Each method has advantages and disadvantages
