Aggregated Search Coherence

[Arguello & Capra CIKM 2012]

- **Aggregated search coherence:** the extent to which results from different sources have a similar query-sense distribution
- **Research question:** Do the query-senses in the image results affect interaction with the web results?
- **Result:** Users are more likely to interact with the web results when the images are more consistent with the intended query-sense (aka the “spill-over effect”)

Research Questions

RQ1

Does the spill-over effect generalize to other verticals besides images?

RQ2

Is the spill-over effect stronger for verticals that include thumbnail images?

RQ3

What factors affect if and when a spill-over happens from a user's perspective?

Outline

Motivation and Research Questions

Experimental Protocol

Study 1 & Results

Study 2 & Results

Discussion

Conclusion

Overview

- Study 1 (RQ1-2): run on Amazon's Mechanical Turk
- Study 2 (RQ3): laboratory study
- Experimental protocol: participants were given a search task and a search interface and asked to find a webpage containing the requested information
- Search tasks: associated with an ambiguous entity and designed to require web results (not vertical results)
- Example: “Find a website that contains information about what causes a snow avalanche”

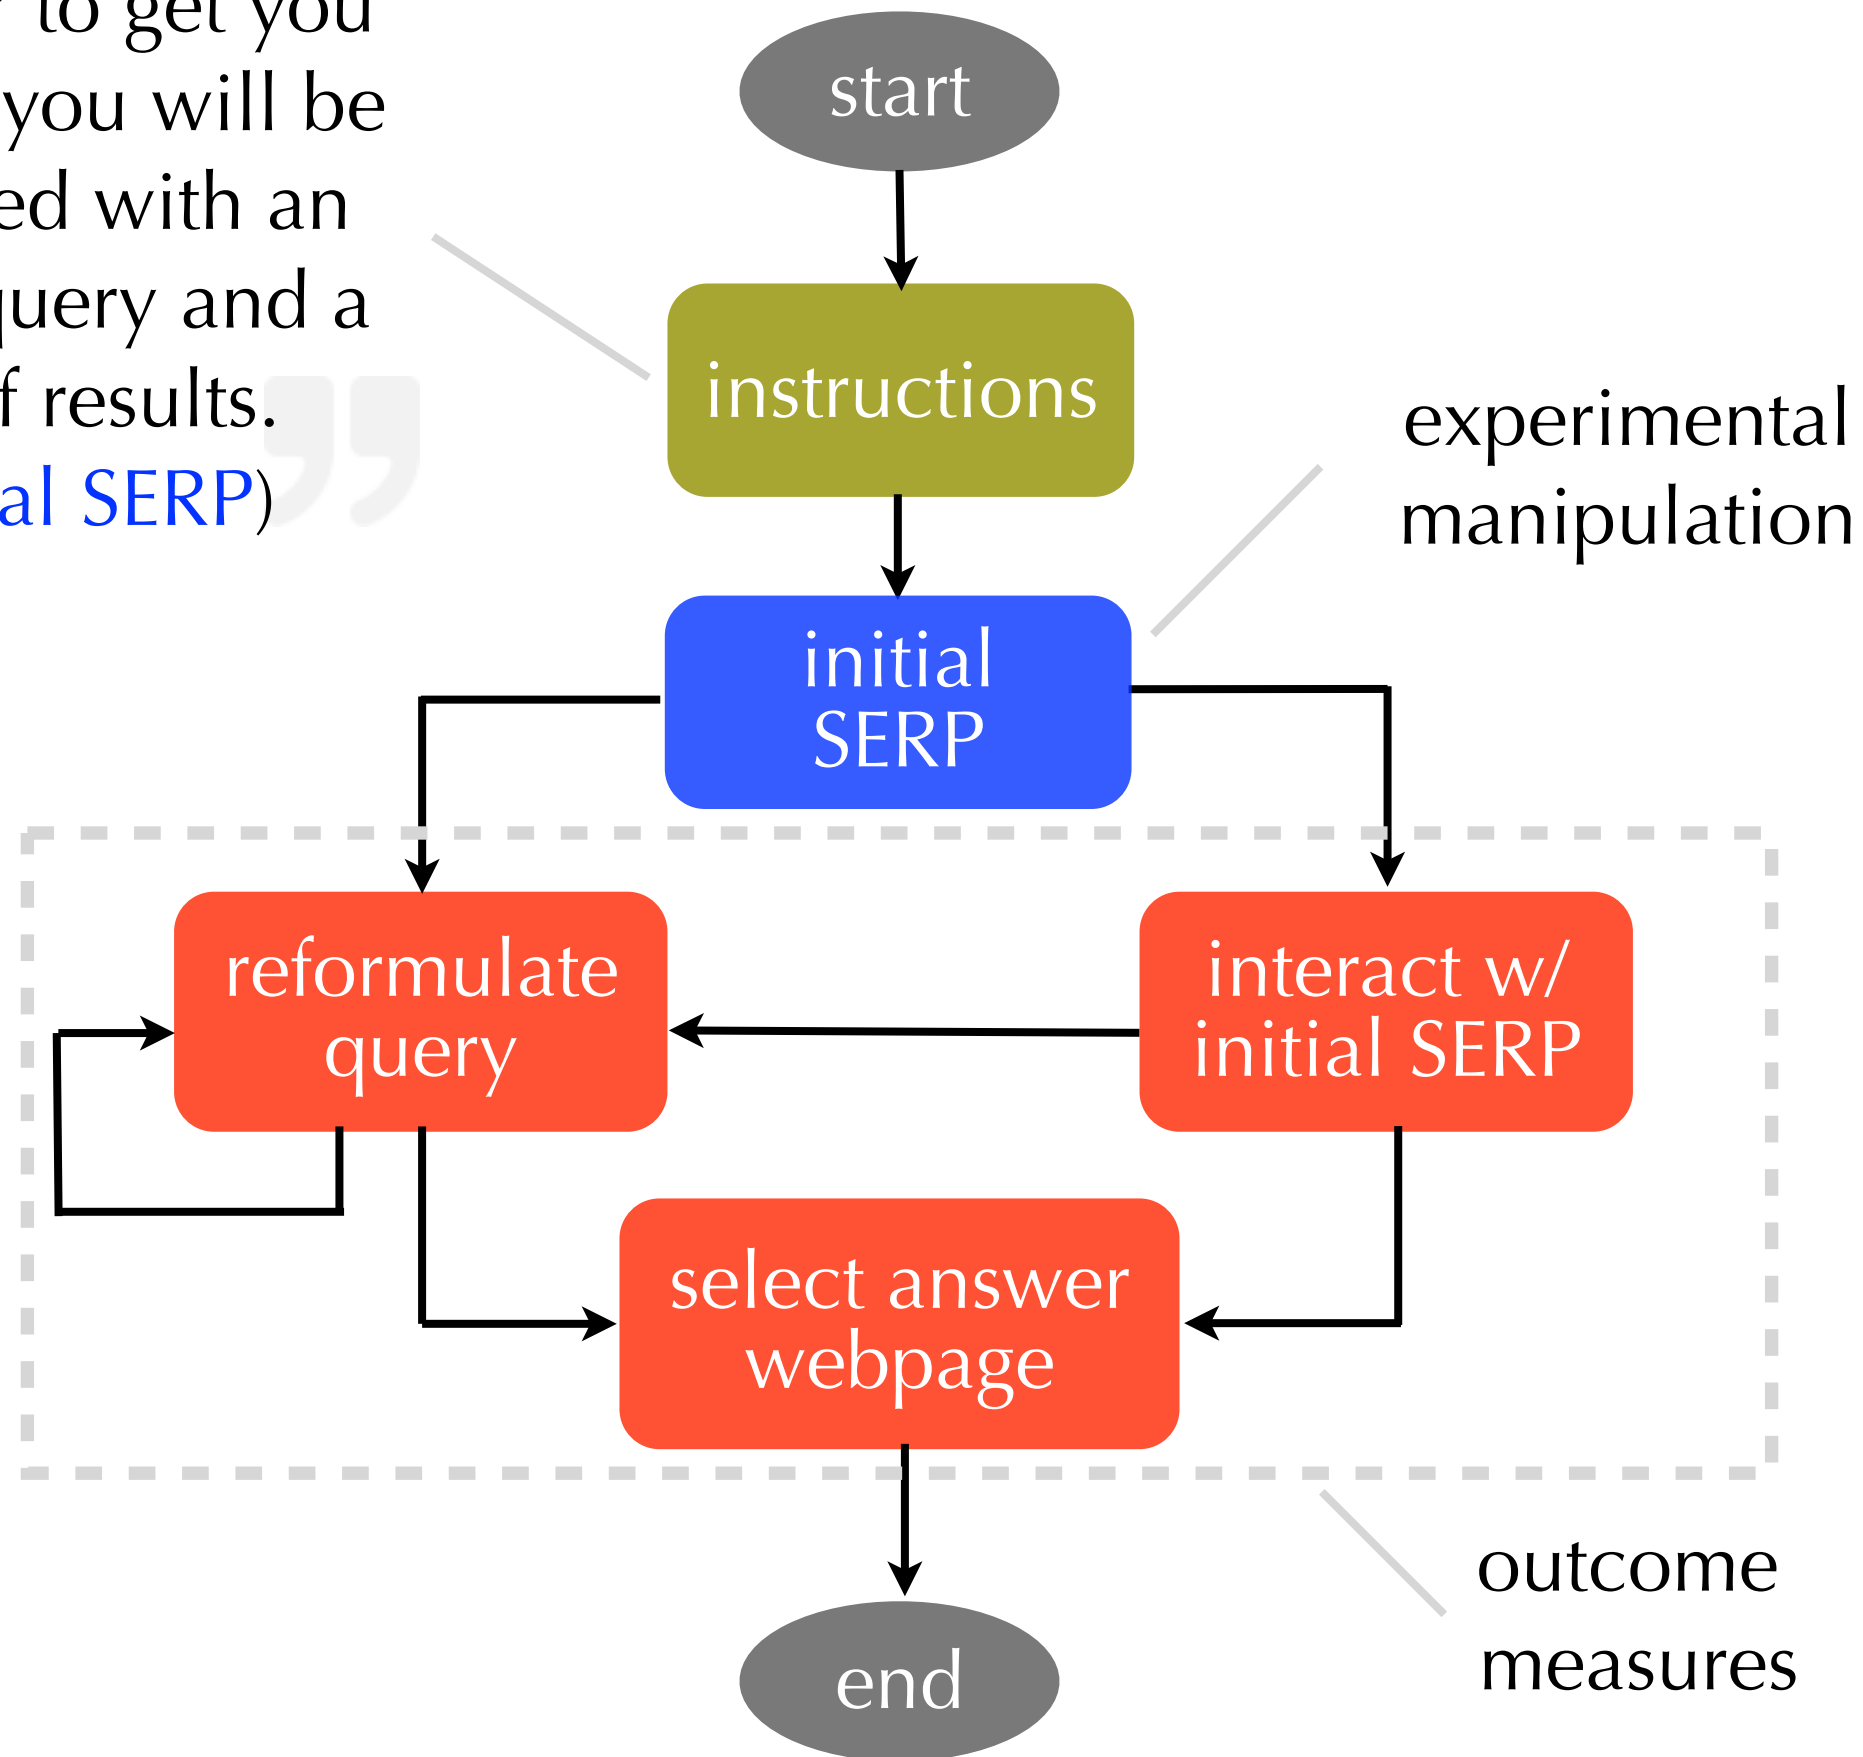

snow
avalanche

chevy
avalanche

Experimental Protocol

“In order to get you started, you will be provided with an initial query and a set of results. (initial SERP)”

Initial SERP

Task: Find a website that contains information about what causes a snow avalanche.

WEB RESULTS: 1-10 of 50

vertical results
(on-target, off-target)

Study 1 (RQ1-2)

- Run on Amazon's Mechanical Turk
- **Vertical:** images, news, shopping, video
- **Vertical image:** news, shopping (with and without thumbnails)
- **Vertical query-sense:** on-target, off-target, mixed
- 75 search tasks per vertical
- 10 redundant search sessions per experimental condition
- 16,500 Mechanical Turk HITs total
- Each HIT was priced at \$0.10 USD
- **Outcome measure (binary):** Did the participant click on at least one web results on the initial SERP?

on-target video

on-target

off-target

Study 1 Results

RQ1

Does the spill-over effect generalize to other verticals besides images?

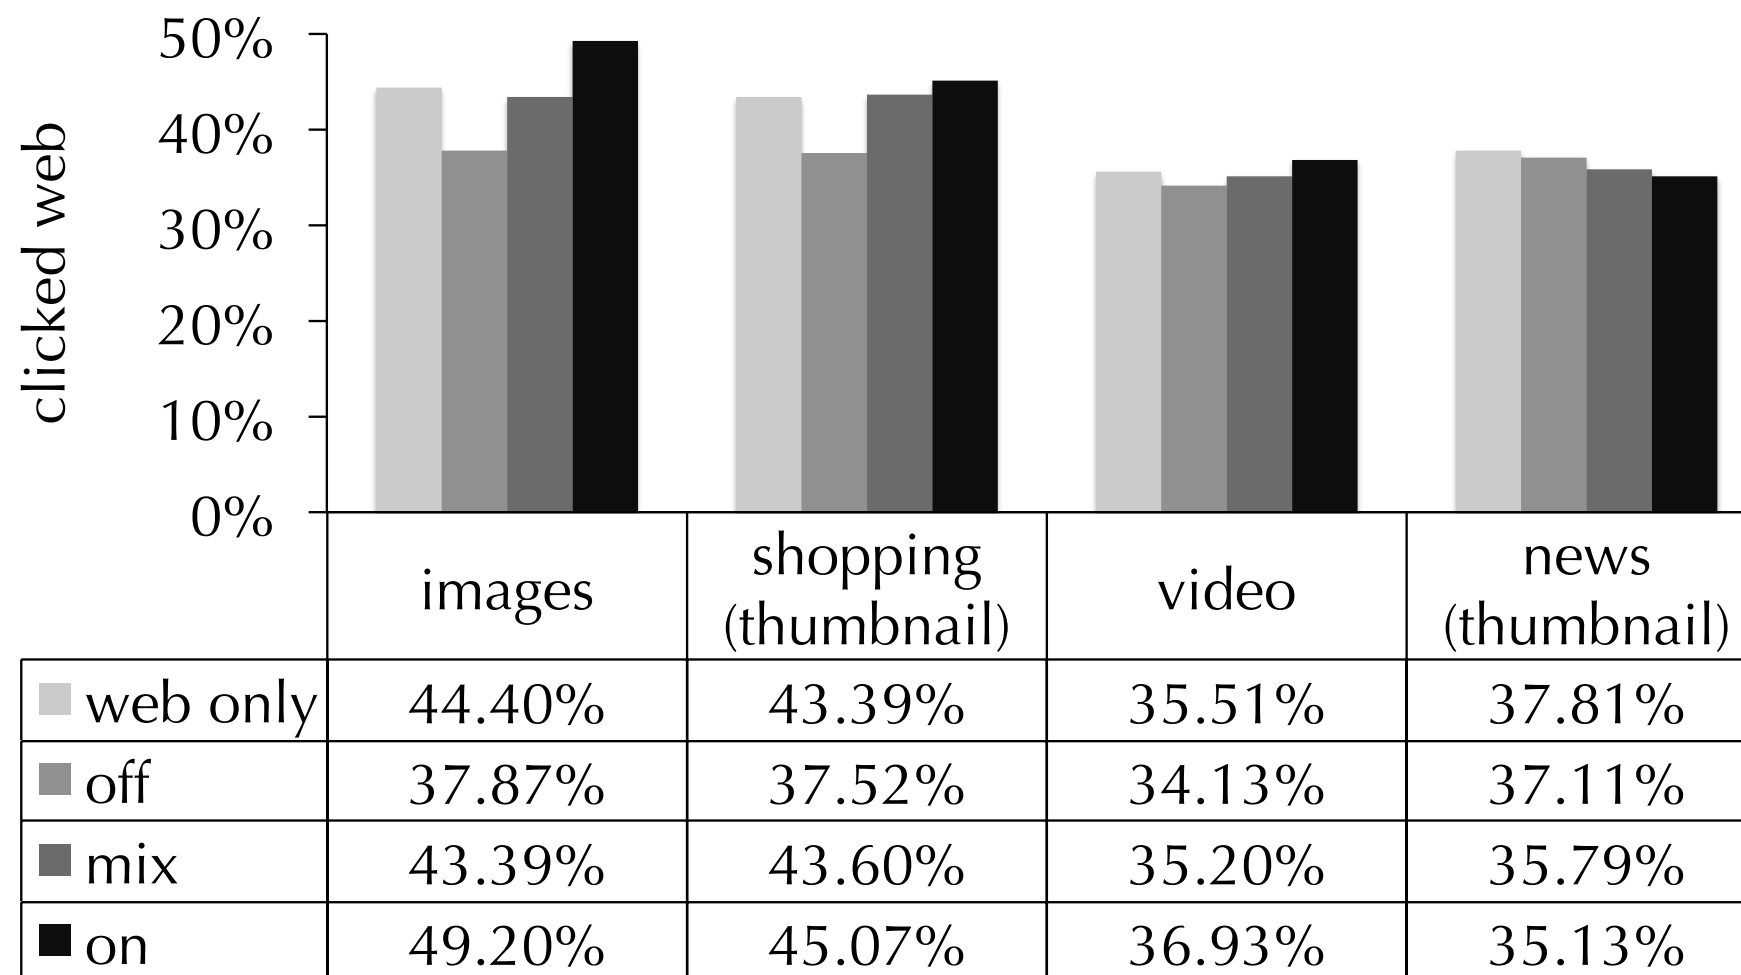

RQ2

Is the spill-over effect stronger for verticals that include thumbnail images?

RQ3

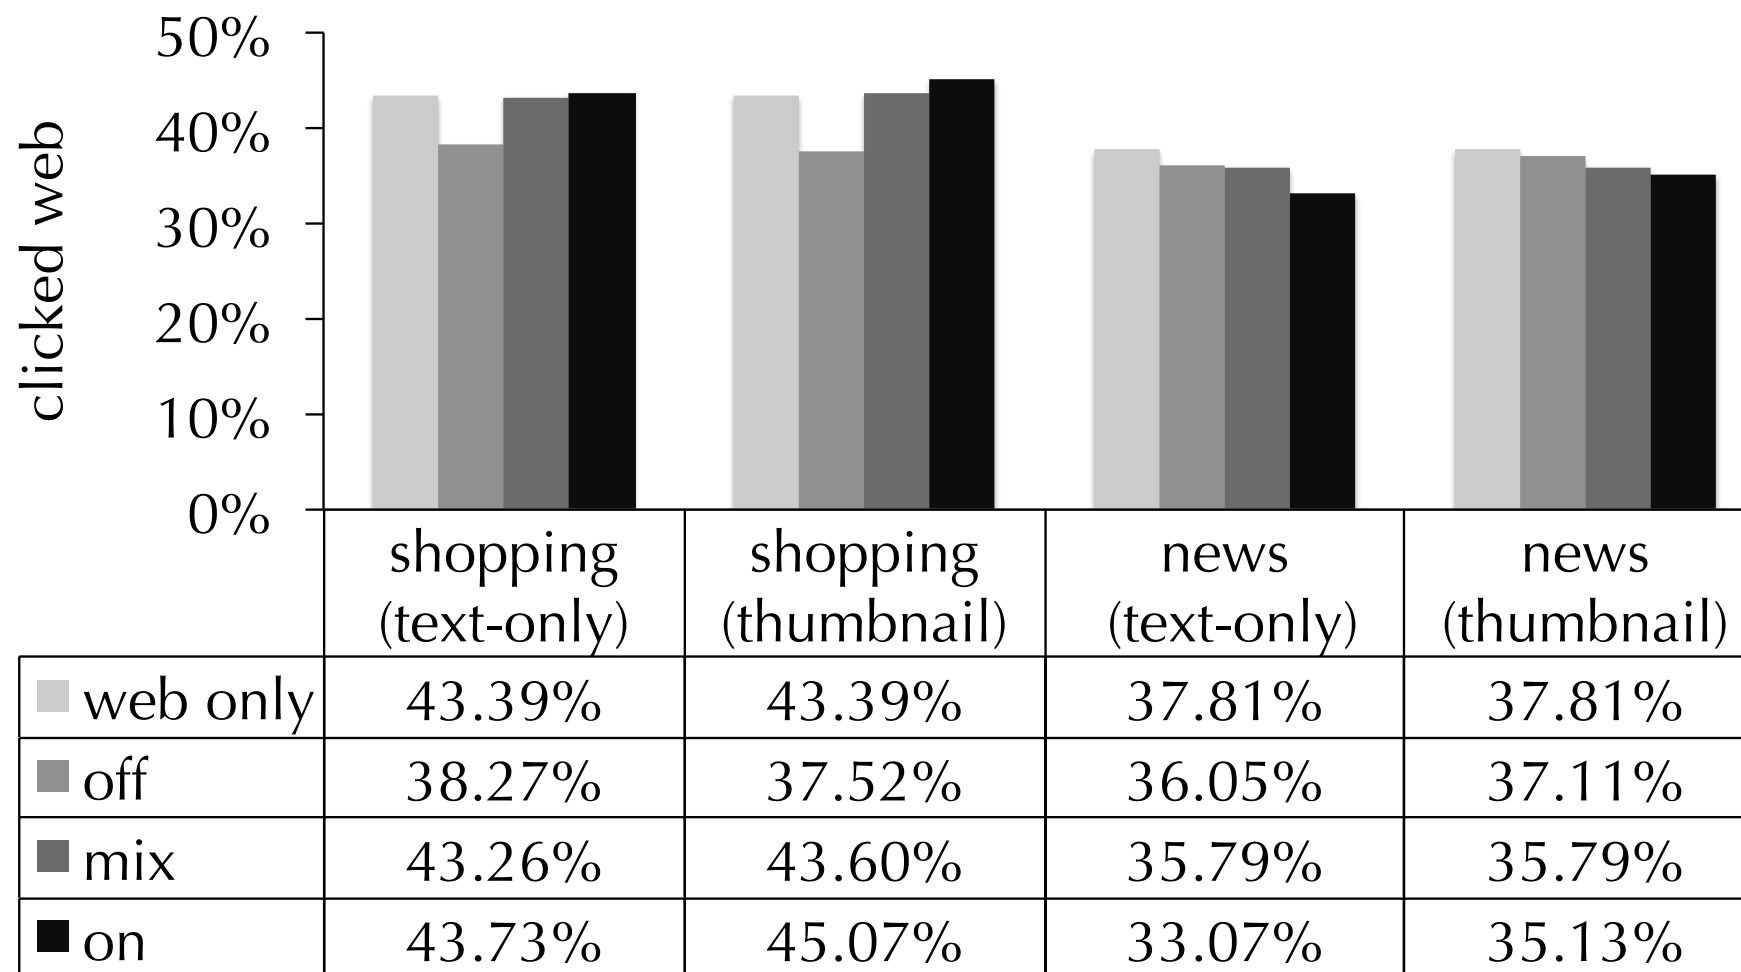

What factors affect if and when a spill-over happens from a user's perspective?

Study 1 Results (RQ1)

- Significant effect for images ($p < .05$) and shopping ($p < .05$)
- Similar trend for video ($p = .726$)
- Different trend for news ($p = .283$)

Study 1 Results (RQ2)

- Logistic regression analysis
- For shopping, the only significant predictor was vertical query-sense ($p < .05$)
- For news, no predictor was significant

Study 2 (RQ3)

RQ1

Does the spill-over effect generalize to other verticals besides images?

RQ2

Is the spill-over effect stronger for verticals that include thumbnail images?

RQ3

What factors affect if and when a spill-over happens from a user's perspective?

Study 2 (RQ3)

- Laboratory study using a retrospective think-aloud protocol
- **Vertical:** images, news (with thumbnails)
- **Vertical query-sense:** on-target, off-target
- 4 search tasks per vertical
- 16 participants (6 male, 10 female)
- Each participant completed 4 tasks

Study 2 (RQ3)

- Searches were recorded and played back to participants
- Participants were instructed to narrate their actions and thought processes on the initial SERP
- At the end of the four tasks, participants were re-played their searches and asked target questions about their actions on the initial SERP
- Think-aloud comments and interview responses were analyzed in order to classify search sessions into one of four categories:
 - ▶ (1) positive spill-over, (2) negative spill-over, (3) no spill-over, and (4) unknown spill-over.

Study 2 Results (RQ3)

- Of the 64 search sessions:
 - ▶ 25 (39%) had (positive/negative) spill-over
 - ▶ 33 (52%) had no spill-over
 - ▶ 6 (9%) had unknown spill-over
- Of the 25 search sessions with spill-over:
 - ▶ 17 (68%) happened for the image vertical
 - ▶ 8 (32%) happened for the news vertical
- Consistent with Study 1 results, the image vertical had more spill-over

Study 2 Results: Positive Spill-over

- The on-target vertical results increased the participant's confidence in the overall results (including the web results)

“ I thought the links on the page [the web results] would be more specific because all the images were about Saint Basil. ”

- Given little prior knowledge about the search topic, the on-target vertical results provided visual cues about things to look for on the SERP

“ When I read the task, I knew that I didn't know anything about the topic... First I saw the pictures and I saw that China Lake is a military base in the California. Then I went back up and started going down the page. ”

Study 2 Results: Negative Spill-over

- The off-target vertical results decreased the participant's confidence in the overall results (including the web results)

“ I knew that these pictures were about the TV show [off-target news thumbnails]. That was the biggest indicator that the results were about the TV show [and not the Big Bang Theory of the universe] ”

Study 2 Results: No Spill-over (1)

- The top (on-/off-target) web results caused the participant to not even perceive the vertical results.

“ I don't think I looked at these [news vertical results]. I looked at the top result and noticed it said something about vacations [the off-target query-sense] and decided that the query was too general. ”

Study 2 Results: No Spill-over (2)

- The participant perceived the vertical results as being a specific type of result, not relevant to the task, and did not process them enough to recognize their on-/off-target query sense.

“ I did notice the news results again [off-target news]. But, because I was looking for historical information [about the first World Series of baseball] I didn't try to figure out what they were about. Now I see that they're about the World Series of Poker. ”

Study 2 Results: No Spill-over (3)

- The participant perceived the vertical results and processed them enough to recognize their query-sense, but did not perceive the off-target query-sense as being off-target.

“ I noticed these briefly [off-target images] and figured that this place [Saint Basil's Cathedral] had to be somehow related to the Saint. ”

Discussion: RQ3

- Insights gained from Study 2 suggest that three things must happen for a spill-over to happen:
 1. perceive the vertical results
 2. process them enough to recognize their on-/off-target query-sense
 3. let their query-sense increase/decrease their confidence in the SERP as a whole

Discussion: RQ3

- Factors that may affect the likelihood of a spill-over effect

| | perceive | recognize | confidence |
|----------------------|----------|-----------|------------|
| web results | ✓ | | |
| vertical relevance | | ✓ | |
| cognitive load | | ✓ | |
| query-sense relation | | | ✓ |
| user's mental model | | | ✓ |
| layout | | | ✓ |

Discussion: RQ1

- The spill-over effect did not generalize to the video and news verticals
- **Hypothesis:** news and video results required more cognitive effort to process
- News results included more text than the other verticals
- Video results were presented using still-frames
- Participants may have perceived the video and news results
- However, given that the tasks did not require vertical results, participants may have not expended the effort to recognize their query-senses

Discussion: RQ2

- Including thumbnails did not moderate the spill-over for the news and shopping results
- **Hypothesis:** thumbnails may play a greater role when the vertical is blended lower in the web results
- Vertical results were presented between web ranks 3 and 4 (above the fold)
- Thumbnails may increase the likelihood of perceiving the vertical results when the vertical is ranked lower

Implications for IR

- Aggregated search

- ▶ Approaches to vertical selection and ranking assume that all false positive predictions are equally bad
- ▶ New approaches may need to consider their (positive or negative) effect on other components in the page
- ▶ These approaches may need to consider different factors of the vertical, the user, and the layout

- Web result diversification

- ▶ Approaches to diversity ranking assume homogeneous results (e.g., only web results)
- ▶ New approaches may need to consider the amount of diversification from verticals presented on the SERP

Conclusions

- Given an ambiguous query, the query-senses in the vertical results can affect user interaction with the web results
- The spill-over effect happens for some verticals (images, shopping), but not others (video, news)
- Including thumbnails in the vertical results has little effect (at least when the vertical is ranked high)
- Different factors are likely to influence whether a spill-over happens
- As search engines increasingly integrate more content from independent systems, understanding and modeling cross-component effects will greatly affect the user experience

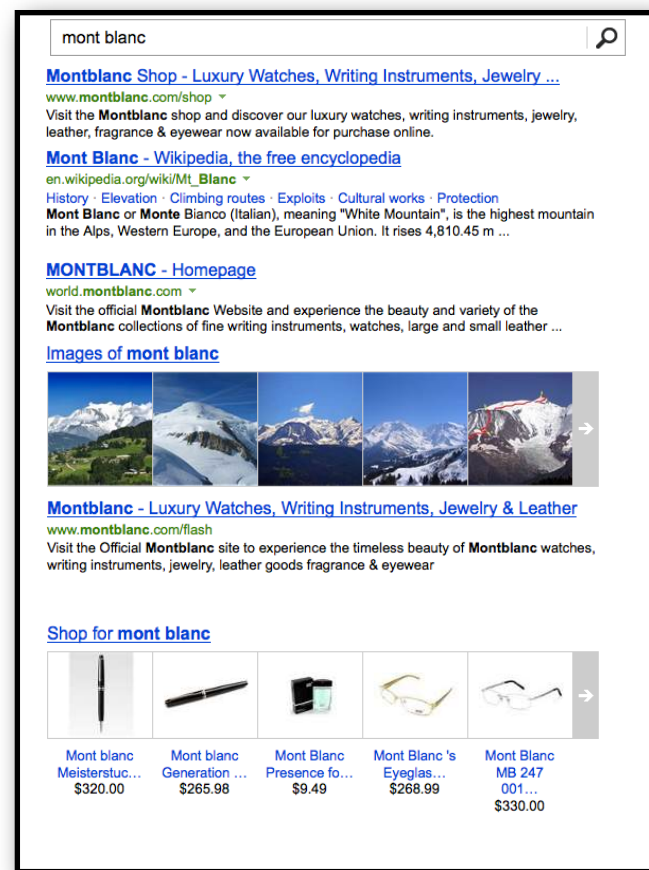

Thank you!
Questions?

Supplemental Slides

Aggregated Search

- predicting which verticals to present and where to present them

“mont blanc”

Aggregated Search Coherence

- The extent to which results from different sources focus on similar senses of an ambiguous query
 1. Users issue ambiguous queries
 2. Aggregated search systems follow a “pipeline” architecture: results from different sources are independent of each other
 3. Different collections may have a different query-sense distribution
 4. Different ranking algorithms may favor different query-senses

Study 2 Results: No Spill-over

- The participant noticed the vertical results, processed them enough to recognize their on-target sense, expended effort trying to assess their relevance to the task, and upon judging them non-relevant, decided to try an entirely different query.

“ I looked at the images [on-target news thumbnails], but nothing seem tourism-related. That’s when I said: Forget it, I’m just gonna do a totally different query. ”
